## **Liquidity coverage ratio**

### Introduction

The Liquidity Coverage Ratio (LCR) report for Samba Financial Group (“Samba” or “the bank”) has been prepared in accordance with the public/ market disclosure requirements and guidelines in respect of the Liquidity Coverage Ratio Disclosure Standards as published by the Saudi Arabian Monetary Agency (SAMA) in August 2014.

The purpose of this document is to disclose both qualitative and quantitative information regarding Samba’s liquidity position, LCR results and internal liquidity risk measurement and management processes.

Liquidity risk is defined as the risk that a bank does not have enough financial resources to meet its obligation and commitments to a customer, creditor, or investor as they fall due. It is the risk to earnings or capital arising from a bank’s inability to meet its obligations when they come due without incurring unacceptable losses. It generally arises from either an inadequate liabilities profile or a bank’s failure to recognize or address changes in market conditions that affect its ability to liquidate assets (i.e. convert them to cash) quickly and with minimal loss in value. The objectives of liquidity management are to ensure that all maturing obligations and commitments are paid fully promptly.

Samba Financial Group’s Board of Directors has the overall responsibility of bank’s liquidity risk management for ensuring the risk exposures are maintained at prudent levels. To this end, it has established an appropriate liquidity risk management framework for the management of the bank’s funding and liquidity management requirements. To assist in overseeing the risks to which Samba is exposed, the Board appoints Board Committees and defines their terms of reference. The Executive Committee of the Samba Board of Directors formulates high level strategies and policies and monitors the bank’s risk profile on an ongoing basis. The bank’s liquidity risk policies are designed to identify and quantify these risks, set appropriate limits in line with the defined risk appetite, ensure effective control and monitor adherence to appropriate limits. The bank’s Asset and Liabilities Committee (ALCO) is responsible for monitoring and management of liquidity, the balance sheet and market risks while the Market Risk Policy Committee (MRPC) is the management body for market and liquidity risk issues, including establishing and updating policies and guidelines, reviewing and approving market risk limits, assumptions and exceptions.

Samba manages liquidity risk by setting conservative loans to deposits ratio, maintaining adequate reserves, high quality liquid assets, banking facilities and reserve borrowing facilities and continuously monitoring forecast and actual cash flows. The bank’s appetite for funding liquidity risk (i.e. funding of longer tenor assets by shorter contractual tenor liabilities) is expressed in the liquidity risk limits framework. This limits framework also includes liquidity ratio targets that set the appetite for funding diversification (in terms of funding sources and tenor), minimum holdings of liquid assets, large fund providers and cross currency funding which also act as early warning indicators of structural balance sheet changes. Appetite for risk is also constrained by the requirement to be fully liquid under adverse scenarios. This is assessed through regular stress scenario analyses covering market-wide events, entity specific events and a combination of the two.

The risk appetite as expressed in the liquidity risk limits framework is also aligned with the regulatory risk framework which mandates compliance with the two key risk measures, Liquidity Coverage Ratio (LCR) and Net Stable Funding Ratio (NSFR).

Liquidity Coverage Ratio (LCR)

The LCR is one of two minimum standards for funding liquidity (the other being the Net Stable Funding Ratio - NSFR) introduced by Basel III, to promote short-term resilience of a bank's liquidity risk profile by ensuring that it has sufficient High Quality Liquid Assets (HQLA) to survive a significant stress scenario lasting for one month.

The LCR has two components:

- (a) Value of the stock of HQLA in stressed conditions; and
- (b) Total net cash outflows, calculated according to the scenario parameters outlined in the Basel III LCR standards document<sup>1</sup>.

The LCR is defined as:

$$\frac{\text{Stock of HQLA}}{\text{Total net cash outflows over the next 30 calendar days}} \geq 100\%$$

The LCR has been fully effective from 1<sup>st</sup> January 2015 with the minimum requirement set at 60% and rising in equal annual steps to reach 100% by 1<sup>st</sup> January 2019.

	1st January 2015	1st January 2016	1st January 2017	1st January 2018	1st January 2019
Minimum LCR	60%	70%	80%	90%	100%

Average LCR for 1Q 2017 was 222%, which is well above the regulatory minimum threshold of 80% for 2017 as well as the 100% threshold which becomes fully effective in January 2019. This reflects SAMBA's substantial holdings of High Quality Liquid Assets as well as its large base of customer deposits.

High Quality Liquid Assets (HQLA)

HQLA comprises of assets that can be easily and immediately converted into cash at little or no loss of value. There are two categories of assets that can be included in the stock of HQLA. Level 1 assets can be included without limit at no haircut and comprises of coins and banknotes, central bank reserves, Saudi government securities, high quality foreign sovereigns, multilateral development banks and supra nationals. Level 2 assets can be included, subject to the requirement that they comprise no more than 40% of the overall stock of HQLA after haircuts have been applied. This may comprise of certain qualifying government securities, public sector and corporate bonds. For the quarter ended March 2017, the stock of HQLA comprises of 100% Level 1 assets.

Net Cash Outflows

Net cash outflows is defined as the total expected cash outflows minus total expected cash inflows in the specified stress scenario for the subsequent 30 calendar days. Total expected cash outflows are calculated by multiplying the outstanding balances of various categories of liabilities and off-balance sheet commitments by the rates at which they are expected to run off or drawn down. Total expected cash inflows are calculated by multiplying the outstanding balances of various categories of

<sup>1</sup> Basel III: International framework for liquidity risk measurement, standards and monitoring - January 2013

contractual receivables by the rates at which they are expected to flow in under the stress scenario up to an aggregate cap of 75% of total expected cash outflows.

The increase in credit risk weighted assets is mainly on account of the change in risk weight for equity investments in funds<sup>2</sup> implemented with effect from 1 January 2017. Credit risk weighted assets for Dec 2017 have been split into rows 2 and 10 to provide a comparison with Mar 2017 figures.

The increase in counterparty credit risk weighted assets is due to the implementation of the new standardised approach for measuring counterparty credit risk exposures<sup>3</sup> with effect from 1 January 2017.

The increase in market risk weighted assets is mainly attributable to foreign exchange risk.
